

30^m reserve on all expendables when "empty"

At on feedwater: final flag is out really empty -

but still have water in loop and ice on sublimator
which will continue to cool.

but then will use up some of next charge filling sublimator
lines and restarting at 0.3 lbs

For this reason water capability APOLLO 17

for EVA I is always slightly reduced.

but Sun angle is lower + so compensated - although work load higher.
